

Get CLEAN, Get GREEN just like Delta Airlines!

It's not just another Marketing Ploy...

Forerunners in the consciousness of environmental sustainability, Delta Airlines long ago initiated strict guidelines for environmental standards. These standards pertain to a long list of items including but not limited to, cleaning of machine parts, asphalt and runway cleaning/degreasing as well as, run-off of water that effects storm drains. This run-off eventually reaches many of our water systems such as, drinking water and has an impact on everything imaginable. This is just one part of Delta's personal responsibility to "Think Green" and preserve the earth.

For over 13 years, Greg Cox has been a leader in the implementation of these environmental responsibilities. As the PSA and Environmental Coordinator for Delta Airlines, Greg is responsible for making sure Delta meets these compliances and stringent guidelines. He oversees the environmental compliance for such items as light bulbs, filters, oil clean up and a wide variety of processes for his station in Greensboro, NC. This station location encompasses the operations of both "above and below wing" operations.

Some time back, Greg and another supervisor attended a seminar where they were first introduced to the topic of bioremediation and products that utilized bioremedial technologies to eliminate hydrocarbon contamination. At first, they where very skeptical to both the process and the belief that these microbes would actually "eat away" the grease and contaminant's. "It was just too good to be true and this term, "bioremediation" sounded hokey-pokey," states Cox. The product that was introduced at this seminar was SpillAway™ which is produced and manufactured by EnviroLogic and is a fast acting hydrocarbon absorbent. They where informed that the product has multiple uses and contained bioremdial microbes which when in contact with water would activate and literally "eat-away" the hydrocarbon contamination. They further learned that it was safe, harmless to the environment and actually all natural. "This just sounded like another clever marketing play that could not possibly be true," said Cox.

Bioremediation is the process of using naturally occurring, safe and beneficial micro-organisms to degrade environmentally harmful contaminants and turn them into non-toxic compounds.

After the seminar they decided to do an online search of the product. John Paparone was the local distributor for SpillAway+ and they called him to see what additional information and facts they could find out. Lucky for them, John happily provided them with the details, regulation and compliance details as well as samples to see for themselves. John provided them with SpillAway+ and FleetKleen™. Both products are stellar in the field of bioremediation.

Figuring the best way to see what these products actually do, Cox and his associate formulated a test that would provide surprisingly astonishing results. Sitting back behind the facility was an old machine that had been sitting for years with quite a build-up of grease, gunk and other grimy contaminants. By combining both the SpillAway+ and FleetKleen to produce a paste-like substance, they spread it over the old machine and let it sit. Then then sprayed the machine with water (as water is necessary to activate the microbes) and walked away.

That night it rained heavily and when they returned the next morning to their facility, to their utter amazement, the machine looked brand new. Any old and existing residue from the machine had been completely removed. To them, having seen what the machine looked like previously and what it looked like now was just amazing. "I became a true believer states Cox and I and recommend these products to lots of folks." I know it's just too good to be true, but when you see it for yourself, you can't deny its effectiveness.

One of the best advantages aside from its ability to clean the deepest crevices and cracks on any surface is the added benefit of cost savings and time. "This doesn't require any heavy cleaning and you don't have to sweep or pick up the residue and have it hauled away" Cox says with enthusiasm. Environmentally - its a win-win!
